Explanatory note

This report presents the latest estimates and projections as assessed in 1978 for urban, rural, and city population for the world, the more developed regions, the less developed regions, eight major areas and 24 subregions, in addition to 195 countries. They are based on the total population estimates and projections as assessed in 1978 by the Population Division, [1] and are provided for each quinquennial year between 1950 and 2000.

The largest regional groupings used in the tables are the categories of "less developed" and "more developed" regions. The former category includes all countries and other territories of Africa, Asia (excluding Japan), Latin America and Oceania (excluding Australia and New Zealand). The latter category includes all of Europe, the Union of Soviet Socialist Republics, Northern America and the countries just cited as being outside the "less developed" category. Within these two broadest groupings, there are eight "major areas" subdivided into 24 geographical regions.

This working paper provides projections which assume continuation of past urbanization trends irrespective of any special circumstances which might affect these trends after the base year.

The methodology used to project urban population is the United Nations urban-rural growth difference method. Basically, this method involves extrapolating into the future the last-observed urban-rural growth difference. This procedure results in a logistic time path of the proportion urban which has a peak annual absolute gain in proportion

urban of 0.5 and has a maximum urban proportion, eventually to be reached by all countries, of 1.000.[2] The detailed description of methods is explained in the study undertaken by the Population Division (Patterns of Urban and Rural Population Growth, chapter 2).[3]

The estimated and projected urban population for each country between 1950 and 2000 is provided in Table 1. In the short period between 1975 and 1980, the urban population of the world was estimated to have increased by 236 million, or at an annual increment of 47 million per year; of this growth, 23.3% occurred in more developed regions and 76.7% in less developed ones. In 1980, 55.7% of the world's urban population resided in less developed regions but by the end of the century the estimated figure will be 68.1%.

With regard to city population, the Population Division has endeavoured, to the extent possible, to use data or estimates approximating the concept of agglomeration. The agglomeration is defined as the population contained within the contours of contiguous territory inhabited at urban levels of residential density. The cities included in this report are all those with a population approaching 100,000 or more inhabitants, according to most recent estimates. The minimum of 100,000 is used for all countries except China. Because of sparse data and the large number of cities for which only rather speculative estimates are available, cities in that country are considered only if their estimated population in 1970 had reached

---

2/ This method is a modification of earlier procedures used by the Population Division to project urban population (see Manual VIII: Methods for Projections of Urban and Rural Population). Under this modification the rate at which the limit of 100 per cent urban is approached is much slower than under past procedures. On the other hand, for populations below 59% urban, the speed of urbanization will be somewhat greater than under past procedures.

200,000. For methods used to project city population, see also Patterns of Urban and Rural Population Growth (chapter 4).

Table 2 presents the percentage urban in the world and its major areas and regions. It will be noticed that, in 1980, 41.0 per cent of the world population was estimated to reside in urban areas; 70.9 per cent of the population in the more developed regions and 30.7 per cent of that in the less developed regions resided in urban areas.

In Table 3 the estimated and projected rural population for each country for 1950 and 2000 is provided. For the latest quinquennial period from 1975 to 1980, the rural population in the world is estimated to have increased by 146 million, which is considerably smaller than the estimated urban population increase of 236 million for the same period. One of the reasons for the slower growth of the global rural population is due to the decline of the rural population in an absolute number in the more developed regions as defined in paragraph 2. In the less developed region, the rural increase of 164 million for 1975-1980 was only slightly smaller than the urban increase of 181 million. The gap between the urban and the rural growth in the less developed regions of the world is expected to increase at least for a coming few decades due to the increasing urban increment and the decreasing rural increment. However in the periods between 1950 and 1975, the rural increase had been substantially larger than the urban increase. The obvious reversal of the urban-rural relationship around 1975 may be seen as a sign of increasing momentum of urbanization in the less developed regions as a whole.

Table 4 presents total population for each country between 1950 and 2000. It is the summation of urban and rural populations.

Table 5 presents the average annual growth rates (continuously compounded) of urban areas, rural areas, and total areas. Although Latin America and East Asia appeared to have experienced the most rapid urban growth in the 1950s, they have been replaced since that time by Africa. The more developed regions have had slowly declining rural populations since 1950, with the rate of decline increasing sharply until the period 1970-1975, after which there was very little change.

The largest cities in the world at various points from 1950 to 2000 are shown in Table 6. It is worth mentioning that the ranking provided in the table are affected by the relative inclusiveness of city boundaries and therefore does not necessarily correspond to the ranking that would be obtained if uniform criteria could be applied in establishing city boundaries. The list of the largest 35 cities reflects the same redistribution of urban population towards the less developed regions during the course of the century that is evident in other aspects of urban growth. Of these 35, those located in the more developed regions were 23 in 1950, decreased to 13 in 1980 and is expected to decrease to 9 by 2000. If we choose the largest 15, the share of the more developed regions is declining continuously from 10 in 1950, to 7 in 1980 and 3 in 2000.

In 2000, there are expected to be 25 cities larger than 10 million in population, compared with only 10 in 1980. Mexico City is projected to be the world's largest city in 2000 with an estimated population of 31.0 million. This projection is the result of calculations based on a rapid rate of national population growth, rapid rate of urbanization and a rapid increase of Mexico City's population relative to the total urban population. Whether such a city size will actually be attained is, of course, yet to be seen.
